Energy & Work

How energy regenerates, and how a work shift turns it into goods, wages, and XP.

🔄 Updated 2026-09-25

Energy

Energy is the fuel behind almost everything you do — working, training, and (later) fighting. It regenerates on its own over time.

- You gain **+1 energy every minute**, in the background.
- Your maximum energy grows with your level:

$$E_{\max}(\text{level}) = \min(300, 100 + 5(\text{level} - 1))$$

So a level-1 citizen caps at **100** energy and the cap rises by **5 per level** up to a hard ceiling of **300**.

Refilling instantly

Two shortcuts top you up without waiting:

- **Food** restores a fixed amount of energy per unit (T1 = 10 up to T5 = 50), limited to **10 food units per day** (all tiers combined).
- **Energy drinks** are bought with gold at **10 drinks per gold**. One use spends **exactly the energy you are missing** (1 drink = 1 energy), then goes on a **10-minute cooldown**.

Working

A work shift converts your energy into produced goods. One click spends as much energy as it can and turns it into units of your company's product.

The output per "block" of energy depends on your stats and your company:

$$u_0 = \left\lfloor 2 \cdot (1 + 0.02 S_{\text{eco}} + 0.015 S_{\text{edu}} + 0.005 (\text{level} - 1)) \cdot m_{\text{company}} \cdot \left(1 + \frac{b_{\text{region}}}{100}\right) \right\rfloor$$

$$u = \max\left(1, \lfloor u_0 \cdot m_{\text{industry}} \cdot m_{\text{crowd}} \rfloor\right)$$

where S_{eco} is your Economy skill, S_{edu} your Education, and b_{region} the region resource bonus (RAW companies only, when the region produces that resource).

m_{company} is your company's own multiplier: a RAW company gives $1 + 0.01 (\text{company level} - 1)$; a factory gives its tier yield times $1 + 0.02 (\text{company level} - 1)$ (see the Formula Reference).

$m_{\text{industry}} = 1 + 0.25 \cdot \frac{\text{industry}}{10} \cdot \frac{\text{electricity}}{10} \cdot \text{crown} + \text{ideology} + \text{convoy}$ is the region's Industry index (scaled by its electricity), plus a flat +0.15 under Socialism and up to +0.10 from a Mobile Workshop in your convoy; m_{crowd} is the region-capacity factor (below 1 when the region is crowded, above 1 for pioneers). A country whose capital fell in the last 30 days works at $\times 0.9$. Both floors drop fractions: a bonus only shows once it pushes u_0 or u past the next whole number — a +10% resource bonus on $u_0 = 6.6$ still yields 6.

Here **crown** is 1.30, 1.20 or 1.10 in the three cities ranked highest by that day's City Score, and 1 everywhere else. Ideology, convoy and Premium are never multiplied by it.

Each block of production costs **10 energy**, so the units you make in one shift are:

$$\text{units} = \left\lfloor \frac{\text{energy} \cdot u}{10} \right\rfloor$$

Energy is only charged for units actually produced — if a factory runs short on raw materials, the unspent energy stays in your pool.

Wages, tax, and XP

- You earn your employer's **wage**, scaled by the energy you actually spent, minus your country's income tax (see [Markets, Tax & FX](#)).
- You gain **4 XP per 10-energy block** worked — see [Leveling & Training](#).

When a shift will not start (7 September 2026)

Your shift wage is paid from your **employer's wallet** in the company's currency. If that wallet cannot cover the wage, the shift does not start and the message says exactly that: "your employer's wallet cannot cover your wage". Your energy is not spent. The employer receives a notice naming you; until they top up, take another job from the job board.
