The Theory of the Parliamentum Economy

A complete tour of the game's economy – every formula, every flow, with worked simulations.

 Updated 2026-09-25

Parlamentum's economy is built on one design law: **nothing is capped, but everything has a cost that grows with it**. Stats climb forever, companies level forever, you may work as many shifts as your energy allows – yet every curve bends, every output has a consumer, and every fortune leaks. This article walks the whole machine: the formulas as they run in the live game, and simulations showing what they mean in practice.

1. Energy – the action currency

Everything you do spends energy, and energy returns on a clock:

$$\text{regen} = 1 \text{ energy} / \text{minute} \ (\approx 1440/\text{day})$$

$$\text{energyMax}(L) = \min(300, 100 + 5(L - 1))$$

A work shift block costs **10 energy**; a war strike spends **all** your current energy in one blow (minimum 10). Food restores energy on top of regen – but at most **10 units per day**, which makes tier choice matter:

Food tier	Energy/unit	Max daily from food
T1	10	100
T3	30	300
T5	50	500

Energy drinks are the only way to buy energy with gold: **1 gold = 10 drinks = 10 energy**, one use per 10 minutes, and a use fills exactly your missing energy. Money buys convenience, never a stat.

Regional Health infrastructure and a convoy Field Hospital speed the clock (section 8), stacking additively:

$$\text{tick interval} = \frac{60\text{s}}{\text{healthMult} + \text{convoyRegen}}$$

2. Stats and training – time is the gate

$$t(n) = 10 \cdot n \cdot 1.1^{n-1} \cdot \frac{1}{1+0.01E} \text{ seconds}$$

The 1.1^{n-1} term is the real wall. Cumulative queue time (at $E = 0$):

Target stat	Single level	Cumulative from 0
20	~2 min	~2 hours
40	~4.6 h	~1.6 days
50	~13 h	~5.4 days
60	~46 h	~18 days
70	~6 days	~55 days

Stats never cap – but past ~60 each point is a project measured in days. A region's Education index cuts training time up to **-25%**, a convoy Field Academy up to a further **-10%** (additive). Only one stat trains at a time.

3. Production – the master formula

One work click converts your entire energy into goods:

$$\text{unitsPerBlock} = \lfloor 2 \cdot M_{\text{stat}} \cdot M_{\text{company}} \cdot (1 + \frac{r}{100}) \rfloor$$

$$M_{\text{stat}} = 1 + 0.02 S_{\text{eco}} + 0.015 E + 0.005 (L - 1)$$

where r is the region resource bonus (only when the region's resource matches a RAW company's product). The regional Industry index (and a convoy Mobile Workshop) then scales the block:

$$\text{ups} = \max(1, \lfloor \text{unitsPerBlock} \cdot (M_{\text{industry}} + \text{convoyProd}) \rfloor)$$

$$\text{units produced} = \lfloor \frac{\text{energy} \cdot \text{ups}}{10} \rfloor$$

Company multipliers grow slowly and without cap:

$$M_{\text{RAW}}(n) = 1 + 0.01 (n - 1) \quad M_{\text{MFG}}(n) = Y_{\text{tier}} \cdot (1 + 0.02 (n - 1))$$

with tier yields $Y = 1.0/0.8/0.65/0.5/0.4$ for T1-T5: higher tiers yield fewer units per shift but each unit is worth far more.

Because M_{stat} is linear and training walls near stat 60, a veteran's practical ceiling is about ***3.2–3.5** a newcomer's output — the gap is real, but never utopian.

4. The seven raw materials

Every raw is tied to region geography and to exactly one demand profile:

Raw	Found in	Consumed by
Grain	farm belts	FOOD manufacturing, state building crews
Iron	mining belts	WEAPON manufacturing, military construction
Oil	energy belts	TICKET manufacturing, all construction logistics
Cotton	farm belts	Field Hospitals, hospitals & schools
Timber	forests	Field Academies, schools & industry
Coal	mining belts	Mobile Workshops, power plants
Copper	mining belts (rarest)	Forward Commands, missile systems

Manufacturing burns raws per finished unit on a steep tier curve:

$$\text{rawPerUnit} = 10/20/35/60/100 \quad (T1 \dots T5)$$

Tickets are deliberately oil-hungry: **25/50/90/150/250** oil per ticket. A T5 good therefore locks up **10×** the raw of a T1 — quality is the economy's built-in raw sink.

5. Companies, wages and taxes

Founding **any** company — RAW or MFG, every tier — costs a flat **100 gold** and requires player **level 3**.

Upgrading to level n costs **15n** gold **and** production experience, which the upgrade spends:

$$\text{exp}_{\text{MFG}}(n) = \text{round}(275 \cdot (n - 1)^{1.5} \cdot Y_{\text{tier}}) \quad \text{exp}_{\text{RAW}}(n) = \text{round}(200 \cdot (n - 1)^{1.5})$$

Money alone cannot level a company — the grind cannot be skipped. Closing refunds half of everything invested. A company employs at most **min(50, level)** workers.

A worker's wage per 10-energy block:

$$w = w_{\text{base}} + \left\lfloor \frac{S_{\text{eco}} \cdot m}{100} \right\rfloor$$

recomputed from the worker's *current* skill each shift, then scaled by energy actually spent. Income tax (set by parliament, capped at **50%**) comes off the top; production tax takes a share of output **in kind** into the state stockpile; import/export taxes guard the global market. Any positive taxed amount owes at least 1 unit — there is no tax-free trickle.

6. Markets

- **Local market** — trades in the state currency, income tax applies.
- **Global market** — trades in gold across borders; import tax (buyer's state) and export tax (seller's state) both apply; embargoes hide markets between hostile states.
- **FX** — player order book between gold and the ten currencies, plus a government desk where treasuries post standing gold rates.

Charts track the **volume-weighted average price of executed trades** — offers can be withdrawn, trades cannot.

7. The war economy

War is the economy's furnace. A strike spends all energy and burns weapons scaled by your level:

$$\text{weaponsPerBlock} = 1 + \lfloor L/10 \rfloor$$

$$\text{damage} = \lfloor \text{weapons} \cdot (5 + S_{\text{str}}) \cdot Y_w \cdot (M_{\text{military}} + \text{convoyDmg}) \rfloor$$

with weapon tier multipliers $Y_w = 1.0/1.5/2.0/2.5/3.0$. Since Update 24 the result is rolled: a uniform swing of $\pm 10\%$, and a 5% chance of a critical at $\times 1.5$ — variance the individual feels and the war-long total barely notices. War pays **20 XP per 10 energy** — five times the work rate — making it the fastest ladder and the deepest sink at once: a high-level fighter can burn through several producers' daily output in a single war day.

8. Regional indexes and the Convoy

Buildings raise five regional indexes (0–10). Four grant bonuses to anyone standing in the region, all scaled by the electricity index:

$$\text{bonus} = \text{max} \cdot \frac{\text{idx}}{10} \cdot \frac{\text{elec}}{10} \cdot \text{crown}$$

Here **crown** is 1.30, 1.20 or 1.10 in the three cities ranked highest by that day's City Score, and 1 everywhere else. Ideology, convoy and Premium are never multiplied by it.

Index	Max effect
Health	+50% energy regen
Education	−25% training time
Industry	+25% production
Military	+20% war damage

The **Convoy** is your personal, portable echo of that system: one convoy per player, up to four structures (slots unlock at levels 25, 50 and 100; the fourth slot rides only with an active Premium), each built at a chosen level 1–10 and granting $\text{cap} \times L/10$:

Structure	Signature raw	Cap at L10
Field Hospital	Cotton	+20% regen
Field Academy	Timber	−10% training
Mobile Workshop	Coal	+10% production
Forward Command	Copper	+8% damage

Construction is a **site project**: the bill (base row $\times$ level, touching all seven rows) is delivered from storage in installments; locked materials are non-refundable. A finished structure lives exactly **7 days**, then collapses — no maintenance, no extensions. The convoy travels with you instantly; convoy caps are ~40% of the regional maxima by design, so developed regions and the wars fought over them always matter more.

9. The state ledger

Treasuries earn taxes and donations; they spend on buildings through parliament. Every building bill spans **all seven rows** with a thematic signature (~35–47% of the bill) — a hospital is cotton-heavy, a power plant coal-heavy, a missile system copper-heavy — so one construction project moves seven markets at once.

10. Gold: faucets and sinks

Faucets (gold in)	Sinks (gold out)
Level-ups: $3L$ per level reached	Training: n gold per stat level

Faucets (gold in)	Sinks (gold out)
Daily reward: 1	Company founding & upgrades ($15n$, uncapped)
Tutorial/referral one-times	Energy drinks (1 g = 10 energy)
Real-money shop	Convoy site fees ($5 \times$ level)
	Party (20), newspaper (5), state donations

Organic faucets are one-time or trickle-sized; the sinks scale with ambition. Gold holds value because goods cannot glut: production tops out near $\times 3.5$ per player while war, construction and convoy cycles consume without cap.

11. Simulations

A. Day one

A new citizen lands with **500 local, 50 gold, 3 tickets**, stats 0, level 1. Full energy (100) worked in one click at $\text{ups} = 2$: $\lfloor 100 \cdot 2/10 \rfloor = 20$ units. At a 30-local block wage: gross $30 \times 10 = 300$, minus 10% income tax $\rightarrow$ **270 local**. First skill training: 1 gold, 10 seconds. The loop is visible in the first minute.

B. A month-old producer's day

Profile: $S_{eco} = 25$, $E = 20$, $L = 25$; RAW cotton company level 8 in a +20% cotton region; Industry index 6, electricity 8.

$$M_{\text{stat}} = 1 + 0.5 + 0.3 + 0.12 = 1.92$$

$$\text{unitsPerBlock} = \lfloor 2 \cdot 1.92 \cdot 1.035 \cdot 1.2 \rfloor = 4; \text{industry} = 1 + 0.25 \cdot 0.6 \cdot 0.8 = 1.12 \rightarrow \text{ups} = \lfloor 4 \cdot 1.12 \rfloor = 4.$$

Spending ~600 energy across a day: $\lfloor 600 \cdot 4/10 \rfloor = 240$ cotton. Sold at 4 local: 960 gross, ~864 after tax. That cotton is roughly three convoy-hospital builds, or the cotton line of ~8 state hospital units — one dedicated producer feeds a handful of consumers, never a whole nation.

C. A fighter's war day

Profile: $L = 30$ (energyMax = 245), $S_{str} = 40$, T3 weapons, Military index 5 / elec 8, Forward Command L5 (+4%).

$$\text{Blocks: } \lceil 245/10 \rceil = 25; \text{ weapons burned: } 25 \times (1 + 3) = \mathbf{100 \text{ T3 weapons.}}$$

damage = $\lfloor 100 \cdot 45 \cdot 2.0 \cdot (1.08 + 0.04) \rfloor = \mathbf{10,080}$

XP: $20 \cdot 245 / 10 = 490$, $\times 1.2$ education bonus $\rightarrow$ **588 XP**. At ~ 96 local per T3 weapon that strike cost $\sim 9,600$ local — the iron behind it is **2,000 raw**, several producer-days consumed in one afternoon. War is why goods never rot on the shelves.

D. A convoy week

Mobile Workshop L6: bill = base row $\times 6 \rightarrow$ **84 coal, 24 timber, 24 iron, 18 copper, 12 grain, 12 oil, 6 cotton** + 30 gold fee. For 7 days it grants +6% production. Producer B above gains ~ 14 cotton/day $\rightarrow$ **~ 100 units over the week** — comfortably above the bill's market value, but only if he keeps working. Idle convoys are pure loss; active ones compound. That is the economy in one sentence: *Parlamentum pays those who show up.*
