BOOK GETTING STARTED

ENERGY & WORK

How energy regenerates and refills, how a work shift turns it into goods, wages and XP, and what stops a shift.

UPDATED 2026-10-09

ENERGY

Energy is the fuel for the two things you do with your hands: **working** and **fighting**. Training does not use it — training costs gold and time (see Leveling & Training). Energy regenerates on its own over time.

- You gain **+1 energy every minute**, in the background.
- Your maximum energy grows with your level:

$$E_{\max}(\text{level}) = \min\left(300,\ 100 + 5\,(\text{level} - 1)\right)$$

So a level-1 citizen caps at **100** energy and the cap rises by **5 per level** up to a hard ceiling of **300**, reached at level 41.

FASTER REGENERATION

Where you stand changes how fast the bar refills. These bonuses add together:

- the region's **Health index** — up to **+50%** in a fully built, fully powered region, and more in one of the day's three best cities;
- **Conservatism** as the ideology of the state that holds the region — **+25%**;
- a **Field Hospital** in your convoy — up to **+20%**.

During **Golden Hours** (17:00–18:00 UTC) regeneration runs **twice** as fast on top of all that. The energy breakdown on your dashboard shows your current pace and what makes it up.

REFILLING INSTANTLY

Two shortcuts top you up without waiting:

- **Food** comes out of your own inventory (bought or produced) and restores a fixed amount of energy per unit (T1 = 10, T2 = 20, T3 = 30, T4 = 40, T5 = 50), limited to **10 food units per UTC day** (all tiers combined; 20 with Premium). Energy never goes above your maximum: whatever a meal would add past it is lost, so eat when you have room.
- **Energy drinks** cost **0.10 gold each** (10 drinks per gold). Buy them on the **Inventory** page (**Brew energy drinks**) — they take no storage space and you can hold any number. One use spends **exactly the energy you are missing** (1 drink = 1 energy), or all your drinks if you hold fewer, then goes on a **10-minute cooldown**. A full bar refuses a drink.

WORKING

A work shift converts your energy into produced goods. One click spends as much energy as it can and turns it into units of your company's product.

The output per "block" of energy depends on your stats and your company:

$$u = \max\Big(1,\ 2 \cdot \big(1 + 0.02\,S_{\text{eco}} + 0.015\,S_{\text{edu}} + 0.005\,(\text{level} - 1)\big) \cdot m_{\text{company}} \cdot \big(1 + \tfrac{b_{\text{region}}}{100}\big) \cdot m_{\text{industry}} \cdot m_{\text{crowd}}\Big)$$

where S_{eco} is your Economy skill, S_{edu} your Education, and b_{region} the region's resource bonus (RAW companies only, when the region's resource is the one the company produces).

m_{company} is your company's own multiplier: a RAW company gives $1 + 0.01\,(\text{company level} - 1)$; a factory gives its tier yield times $1 + 0.02\,(\text{company level} - 1)$ (see the Formula Reference).

$m_{\text{industry}} = 1 + 0.25 \cdot \frac{\text{industry}}{10} \cdot \frac{\text{electricity}}{10} \cdot \text{crown} + \text{ideology} + \text{convoy}$ is the region's Industry index (scaled by its electricity), plus a flat +0.15 under Socialism and up to +0.10 from a Mobile Workshop in your convoy.

Here **crown** is 1.30, 1.20 or 1.10 in the three cities ranked highest by that day's City Score, and 1 everywhere else. Ideology, convoy and Premium are never multiplied by it.

m_{crowd} is the region's capacity. Every shift drains a shared pool by the energy spent, and the pool refills over 24 hours. While it is at least half full there is no penalty; below half, output slides down — never under half. A region where **15 or fewer** players were active in the last day gives its workers a **+10% pioneer bonus**, fading out by 30 players. The dashboard shows the region's capacity and either effect when it applies.

If the company's country lost its capital in the last 30 days, the rate is multiplied by **0.9**.

Each block of production costs **10 energy**, so the units you make in one shift are:

$$\text{units} = \left\lfloor \frac{\text{energy} \cdot u}{10} \right\rfloor$$

The rate itself is never rounded — only the final count of units is, so every bonus counts. A rate of 6.6 per block with a +10% resource bonus becomes 7.26, and 100 energy makes **72** units.

Energy is only charged for units actually produced — if a factory runs short of raw materials, the unspent energy stays in your pool.

WAGES, TAX, AND XP

- A money wage is set **per 10-energy block** and paid in proportion to the energy you actually spent. It comes from your **employer's wallet** in the currency of the country where the company stands, and that country's **income tax** is taken off (see Markets, Tax & FX). In an independent region the wage is paid in US dollars, untaxed.
- Some jobs pay a **share of the output** instead — at least **10%** of every unit you make, delivered to your storage.
- Working in **your own company** pays no wage: the goods stay in the company.
- You gain **4 XP per 10 energy** worked, doubled during Golden Hours — see Leveling & Training.

How wages are set and how each stat lifts your output is on Stats and Companies & Production.

WHEN A SHIFT WILL NOT START

A shift is refused — and no energy is spent — when:

- you are **in flight**;
- you have **no job** (take one on the jobs board, or employ yourself in your own company);
- you hold neither **citizenship nor a work permit** for the company's country;
- you are **not in the company's region**;
- you don't have enough energy to produce even **one unit**;
- the factory has **no raw materials** (or a plant has run out of an input);
- your job pays a share and your **storage for that product is full** — a shelf with a little room left shortens the shift instead.

Your wage is paid from your **employer's wallet** in the company's currency. If that wallet cannot cover the wage, the shift does not start and the message says exactly that: "your employer's wallet cannot cover your wage". Your energy is not spent. The employer receives a notice naming you, with the shift's cost and what the wallet held; until they top up, take another job from the job board.

STORAGE AND A FULL SHELF

Everything you carry sits on a shelf per item and tier, and each shelf has a limit that grows with your level, Strength and Economy (the numbers are on Leveling & Training). Your **Inventory** page shows every shelf. A full shelf:

- refuses a **market purchase** of that item until you make room;
- refuses a **contract** whose goods would not fit (both sides are checked);
- cuts a **share-paid shift** short, or refuses it when nothing fits;
- lets only what fits come out of **your company's** stock, or back from a **listing** you cancel (the rest stays listed);
- takes only what fits of the **tutorial's starter kit** — the rest is not delivered.

Energy drinks are the one item with no shelf.
