BOOK WORLD & CITIZENSHIP

INFRASTRUCTURE & REGION CAPACITY

The six building types, how the 0–10 development indexes work, electricity supply and demand, and the energy pool that decides how many workers a region can feed.

UPDATED 2026-10-09

THE SIX BUILDINGS

Parliament builds infrastructure through **New building** laws: **1 to 25** buildings of one type in one of the state's own regions. The **economy minister** can also enact them directly — the only office that can; not even the president can skip the vote. Every building is paid for by the state: the **gold** from the state treasury and **all seven raw materials** from the state stockpile, so every construction project touches every market. If either can't cover the bill when the law passes, the law fails.

BUILDING	GOLD	SIGNATURE RAW	ELECTRICITY	FEEDS
Hospital	15	Cotton	uses 3	Health index
School	15	Timber	uses 2	Education index
Military Base	18	Iron	uses 4	Military index
Missile System	30	Copper	uses 6	Military index
Industrial Zone (OSB)	22	Coal	uses 5	Industry index
Power Plant	22	Coal	makes 10	Electricity

The full raw bill for one building:

BUILDING	GRAIN	COTTON	TIMBER	IRON	COAL	COPPER	OIL
Hospital	8	30	10	3	3	6	4
School	8	12	30	3	3	4	4
Military Base	10	8	8	26	6	8	8
Missile System	4	2	4	12	8	28	18
Industrial Zone (OSB)	6	6	10	12	14	10	12
Power Plant	4	2	6	10	30	12	10

Two buildings, one Military index. A Military Base and a Missile System count the same toward the Military index — the ranking adds them together, one building each. A Military Base costs 18 gold, mostly in iron, and draws 4 electricity; a Missile System costs 30 gold, mostly in copper and oil, and draws 6.

Buildings belong to the **region**, not to the state: when a region changes hands they stay standing for the new owner — all but what the war razed (see War devastation).

THE DEVELOPMENT INDEXES

Each region carries five indexes on a **0–10 scale**. Four of them are **competitive ranks**: all playable regions are sorted by how many relevant buildings they hold, and split into **ten equal buckets** — the top tenth of the world scores 10, the next tenth 9, and so on (the bucket size grows with the number of playable regions — a tenth of them, rounded up). Building more doesn't just raise you; it can push rivals down.

A region with none of the relevant buildings scores **0**. While only a few regions have built a type, even a single building can put a region in the top bucket.

At index 10, with full electricity, a region grants the people standing in it:

- **Health** — up to **+50% passive energy regeneration**
- **Education** — up to **−25% stat-training time**
- **Industry** — up to **+25% work output per shift**
- **Military** — up to **+20% battle damage**

Each bonus scales linearly with the index, and then with electricity.

On top of the indexes, a state's **ideology** adds a flat bonus on one axis in every region it holds — Conservatism **+25%** energy regeneration, Liberalism **−15%** training time, Socialism **+15%** work output,

Nationalism **+10%** battle damage — whatever the buildings and the electricity (see Parties & Elections). A convoy's structures add their own bonus on top of both.

ELECTRICITY

Electricity is not a rank — it is the region's own **supply ÷ demand**. Power Plants produce 10 units each; every other building consumes some (see the table above). Efficiency is capped at 100% and stored as the 0–10 electricity index, which **linearly scales every other index bonus**. A gleaming district of schools with no power plant teaches nobody. One plant powers roughly 2–3 developed buildings. A region with no power plant has no electricity (0); plants with nothing to power read 100%.

CITY SCORE AND THE THREE MOST DEVELOPED CITIES

Every region also has one **City Score** from 0 to 10: the average of its five indexes, **rounded down**. A region at 10 in all five scores 10; one at 7 · 8 · 7 · 8 · 6 averages 7.2 and scores **7**. A region with no buildings scores 0.

Once a day, at **00:00 UTC**, every playable region is ranked worldwide. The order is decided by:

1. the sum of the five indexes (so 9.8 ranks above 9.0, although both show 9);
2. then the total number of buildings;
3. then the number of active residents.

The score, the rank and the crowns stay **frozen until the next midnight**; the five indexes themselves keep moving as buildings go up.

The **three highest-ranked cities** wear a crown and multiply their index bonuses (at full indexes and full electricity):

	#1 (×1.30)	#2 (×1.20)	#3 (×1.10)
Energy regeneration	+65%	+60%	+55%
Training time	−32.5%	−30%	−27.5%
Work output	+32.5%	+30%	+27.5%
Battle damage	+26%	+24%	+22%

The crown multiplies only the index part: ideology, convoy structures and Premium are added on top, unmultiplied. Like every index bonus it goes to whoever stands in the city, and for work output to the

companies located there. The region table on the Statistics page, the region panel and the dashboard show the scores and the Top 3. The region table also lists each region's buildings and active residents — the two tie-breaks — so an order between equal scores can be checked.

REGION CAPACITY — THE ENERGY POOL

A region can only feed so much labor. Each region has an **energy pool** that work shifts drain (by energy actually spent) and that refills linearly over **24 hours**:

- An undeveloped region supports **40 workers' daily energy** (1,800 energy each).
- Development pays: each **Industry** index point adds capacity for **10 more workers**, scaled by electricity (industry × electricity ÷ 10) — at industry 10 and electricity 10 a region supports 40 + 100 = **140**.
- While the pool sits at **50% or above, there is no penalty**. Below that, work output slides linearly down to a floor of **–50%** — a throughput tax, never a lockout.
- Capacity growth is always safe: when new buildings raise the ceiling, the pool keeps its fullness **ratio**, so construction never worsens the penalty and genuinely helps within hours.

The dashboard's region box shows the pool, the active penalty, and what the region can sustain.

THE PIONEER BONUS

Underpopulated regions court settlers: with **15 or fewer active players** in the region — everyone standing there who has acted in the last 24 hours — everyone working there produces **+10%**. The bonus fades linearly and disappears at 30 active players — the frontier pays until the crowd arrives.

> **TIP**
>
> Governments: a Power Plant next to your Industrial Zones is usually worth more than another Zone — electricity multiplies everything else.
