STATS — STRENGTH, EDUCATION & ECONOMY

What each stat is for, exactly where it pays off, how training raises it — and the world's numbers on the Statistics page.

UPDATED 2026-10-09

WHY STATS EXIST

Levels open doors; **stats decide how hard you hit, how fast you learn, and how much you produce**. There are three, they never decay, and every point keeps working for you forever.

STRENGTH — THE SOLDIER'S STAT

Strength is raw combat power. Every point adds **+1 to the damage base of every weapon you fire**:

$$\text{damage} = \text{weapons} \cdot (5 + S_{\text{str}}) \cdot m_{\text{tier}}$$

where m_{tier} is **1.0 / 1.5 / 2.0 / 2.5 / 3.0** for T1–T5 weapons. A strike with 100 weapons at 0 Strength deals 500 damage with T1 weapons — the same strike at 20 Strength deals 2,500. On top of this base come the front's bonuses (its Military index, Nationalism, a Forward Command in your convoy) and, for 30 days after your country loses its capital, a 10% cut; every hit then swings **±10%**, with a **5%** chance of a critical for **+50%**. How many weapons a strike burns grows with your level, not your Strength: **1 per 10 energy, plus one more for every 8 levels**. Strength also stretches your logistics: each point adds **+3% storage capacity**.

Raise it if: you want to matter on the front line. Damage is how regions are won — see War & the Front.

EDUCATION — THE SCHOLAR'S STAT

Education makes you a faster learner and a better producer:

- **Faster training** — every point divides all future training times: $t \to t/(1 + 0.01\,S_{\text{edu}})$. There is no cap, so it compounds on every stat you ever train, including Education itself.
- **+1.5% production per point** in every work shift.

Raise it if: you think long-term. Education makes every other stat cheaper to build.

ECONOMY — THE PRODUCER'S STAT

Economy is the biggest single lever on your output and income:

- **+2% production per point** in every work shift — a third more than an Education point in the shift formula.
- **Higher wages** — a job pays `base + Economy × multiplier ÷ 100` per 10-energy block (rounded down to the cent), so skilled workers literally earn more from the same job — at a 1.00 multiplier each Economy point adds 0.01 local. Your **current** Economy always counts. The job's terms are copied when you are hired, so later changes to the company's offer don't touch you; the owner can still change your own base wage (or your share) at any time, while your multiplier stays as hired.
- **+2% storage capacity** per point.

Raise it if: you work for a living — factory hands, company owners, and traders all live off this stat.

HOW TRAINING WORKS

Training runs on the dashboard, **one stat at a time**, and each session raises the stat by one. It costs gold and time — never energy:

- **Cost:** level n costs n gold.
- **Time:** $\max\left(1,\ \text{round}\left(0.2894 \cdot n^{2.5}/(1 + 0.01\,S_{\text{edu}})\right)\right)$ seconds, before the cuts from where you train, your convoy and Premium.

Early points are near-instant; later ones are real commitments — before any bonus the 100th point takes about 8 hours — which is why the Education discount matters. The cuts and full numbers live on Leveling & Training and the Formula Reference.

THE STATISTICS PAGE

Statistics in the World menu shows the world in numbers. Its rail opens an **Overview** and five ledgers.

- **Overview** — how many citizens, countries, regions (and how many of them are independent), parties and companies exist; **the world's record, all time**: wars declared and how many are still raging, rebellions, damage dealt, weapons fired, buildings standing, articles published, newspapers and contracts sealed; and the leaders of each ledger.
- **Players** — how many citizens are in the world, in your country and in your region, with the top ten by level, Strength, Education and Economy.
- **Countries** — the most citizens and the largest territory.
- **Political parties** — the largest parties and the most parliament seats.
- **Regions** — the best cities by City Score, the most populous regions, and regions by resource.
- **Companies** — mines, factories and workers counted, the highest-level companies, and companies by product.

Every ledger opens a **Full table**: search it, sort it by any column, and narrow it with filters — level band, country, active or inactive, resource, City Score, product or company class, depending on the ledger.

The headline population figures count only active citizens; the tables list everyone.

WARS BY THE NUMBERS

The Wars menu splits the fighting in two: **Homeland Wars** lists the fronts your country is fighting on, **World Wars** the conflicts elsewhere on the map. Each shows its open fronts, fighters engaged, strikes landed and total damage, then the live fronts and the recently finished wars. Both carry a **Top wars** button: the ten biggest wars ever fought, ranked by the damage both sides dealt.
