BOOK WAR

WAR & THE FRONT

Declaring war through parliament, fighting on the front, naval landings, rebellions, and how regions change hands.

UPDATED 2026-10-09

HOW A WAR STARTS

A war starts with a **Declare war** law naming one of your regions as the staging ground, a target region (state-owned **or independent**) and an optional casus belli of up to **280 characters**. The **president** or the **defense minister** can enact it directly, and the war begins at once. Otherwise a member of parliament puts it to a parliament vote; if it passes, the war begins immediately. A war vote is never cut short by a foregone tally — it keeps its full 24-hour debate unless everyone has voted or the president or defense minister signs it with a Yes.

What a declaration needs:

- The **staging region** must be a playable region of your own state; the target must be a playable region that is not yours.
- A **land war** needs the staging region to border the target. A **naval war** needs no border — see Naval war below.
- **No war on an ally** — a state you hold an active alliance with cannot be attacked.
- **One fight per region** — neither the staging region nor the target may already be in an active war, as attacker or as target, and only one declaration per region can be in a parliament vote at a time.
- A region under **protection** wears a shield on the map. Shields are set by the game's staff, each for a fixed period. Until the shield ends no war — land, naval or a rebellion — can be declared on the region (the map card and the region panel say when it ends). A protected region may still declare a war itself, but its own shield falls the moment that war starts.

All of this is checked again when the law passes: if the target changed hands, gained a shield or went to war while parliament debated, the law fails with the reason on record and no war starts. A war between two states that share a **trade agreement** ends the agreement the moment it begins.

How long it lasts. A land war contests **one region** for **24 hours**, and so does a rebellion. A naval war runs a 24-hour landing and, if the attackers win it, a 24-hour assault.

the damage both sides dealt. A gold dot pulses on the menu whenever your country is in a war you haven't seen yet.

FIGHTING

To fight you must physically stand on the front: attackers travel to the **staging region**, defenders to the **contested region**. You cannot strike while in flight.

One strike spends **all your current energy** (minimum **10**) and burns weapons of the tier you choose:

- **Weapon burn** — you spend $1 + \lfloor \text{level}/8 \rfloor$ weapons per 10 energy. A part-block counts as a whole one: a 15-energy strike burns two blocks' worth of weapons — and hits with all of them. Higher-level soldiers burn more weapons and deal more damage.
- **Damage** — $\text{weapons} \cdot (5 + S_{\text{str}}) \cdot m_{\text{tier}} \cdot b$, with tier multipliers **1.0 / 1.5 / 2.0 / 2.5 / 3.0** for T1–T5 and b your strike bonus (below).
- **No two strikes land the same** — every hit rolls a swing between **−10% and +10%**, and **5%** of hits land **CRITICAL** for **+50%** damage. The roll is made on the server, and a critical announces itself in the strike result. Over a war day the swing averages out; the crits are the story you tell afterwards.
- **Short on weapons?** The strike scales down to the whole blocks your stock covers and spends only their energy. With less than one block's worth of weapons you cannot strike.
- **XP** — war pays **20 XP per 10 energy**, five times the work rate, and double during Golden Hours. The front is the fastest way to level in the game.

The strike bonus starts at ×1 and adds:

- the **Military index** of the region you stand in — up to **+20%** at index 10 with full electricity, more in a crowned Top 3 city (see Infrastructure & Region Capacity);
- **+10%** when the state that holds that region follows the **Nationalist** ideology;
- up to **+8%** from a **Forward Command** in your convoy.

If your own country lost its capital in the last 30 days, your damage is cut by **10%** on top (see Losing the capital). On the war page the damage figure opens **Your strike**: the range you will hit for and every part behind it, before you fire.

Every war page shows the live front-line bar, both sides' top fighters, and a **war room** chat where anyone — fighter or spectator — can argue the case. Messages are up to 300 characters, and the thread stays with the war.

Reading the war page. On the war list and the war page, the flag and name of each side are links: a state opens its country profile, an independent region opens the map. Each army panel shows its top five fighters; **Show all** beneath it opens that side's full strike ranking — every fighter with damage dealt, strikes and share of the army's damage — as a sortable, searchable table. Attackers and defenders have separate rankings.

WHO FIGHTS?

Citizenship plays no part — only where you stand:

- Anyone standing in the **contested region** fights for the defender, and anyone standing in the **staging region** fights for the attacker. That includes foreigners, allies and even the attacker's own citizens.
- In a **rebellion** both fronts are the same region: you **pick a side**, and your first strike locks it for the war.
- When an **independent region** is attacked, its **natives** are notified — but, as everywhere, whoever stands there fights for it.

HOW IT ENDS

When the clock runs out, total damage decides it:

- **Attacker ahead** → the region changes hands. If it was the defender's capital, the capital seat is vacated.
- **Tie or defender ahead** → the defenders hold. Attacking has to be decisively better to take land.

Every finished war stays on record. On the map, a region that has seen war carries a small **War history** button next to its name: the list shows each war's sides, the outcome (Captured, Defended, Rebels won, Rebellion crushed, Landing repelled) and both sides' damage, and each row opens the war page.

NAVAL WAR

A war declaration goes **by land** or **by sea**. By sea, any coastal region of yours may attack any coastal region on the **same water**, at any distance — the open sea with the open sea, the **Caspian only with the Caspian**. Every stretch of coast counts. A naval war runs in two phases, and it is fought with **ships** — built by Shipyards (Heavy Industry, see Companies & Production) and traded on the market.

1. The landing (24 hours) is fought with **ships only**, on both sides — weapons cannot be used. A ship strikes like **4 weapons** of its tier, so ships burn in blocks of **40 energy**: $1 + \lfloor \text{level}/8 \rfloor$ ships per block, the same damage per energy as weapons. A landing strike needs at least 40 energy and spends whole blocks only — what is left over stays with you. Nothing is razed in the landing.

When the landing ends:

- **Attackers strictly ahead** → the **assault** opens at once, and the attackers start it with **half the landing's margin**, $\lfloor (A - D)/2 \rfloor$, while the defenders start from zero.
- **Tie or defenders ahead** → the landing is **repelled**: the war ends, the defenders hold and nothing is razed.

2. The assault (24 hours) is fought with **weapons**, by the land-war rules: attackers strike from their own coastal region, defenders from the target. The region changes hands if the attackers end ahead; if they lose, their own coastal region takes the devastation, as in any failed attack.

Auto Mode started in the landing strikes with the ship tier you pick and stops when the landing ends, or when the ships run out. If the landing is won, start it again for the assault with a weapon tier.

LOSING THE CAPITAL

Losing your capital region is a national catastrophe, not just another lost province. For **30 days** the whole country fights on in disarray:

- **–10% production** — every work shift in the country yields less;
- **–10% war damage** — every citizen hits softer on every front;
- **no new capital** can be declared until the 30 days pass. Then the president — or parliament by vote — re-establishes one with a **Move the capital** law on any region the state owns; a capital move made before the loss does not hold it up;
- **no region can be sold or freed** during those 30 days — once the window ends, land can be sold or freed again even if no new capital has been declared yet.

Retaking the old capital region does **not** end the penalty early — the region returns as an ordinary province. And the capital cannot be evacuated once it is under attack: moving the capital away from an active war target is blocked, so capturing a capital is always worth the fight. A banner on the dashboard and the country profile counts down the crisis.

WAR DEVASTATION

War scars the ground it is fought over. When a war ends, the **loser's home region loses buildings** — the conquered target if the attack succeeds, or the attacker's own staging region if the assault fails. In a rebellion both fronts are the same region, so the devastation always falls on the rebelling region, whoever wins. Every building type takes proportional damage.

The rate scales **inversely with the margin of victory**, so overwhelming force is rewarded rather than punished:

$$\text{razed } \% = 10 + 40 \cdot \frac{\text{loser's damage}}{\text{winner's damage}} \quad \text{(ratio capped at 1)}$$

and each building type loses that share of its count, rounded.

HOW THE WAR WENT	BUILDINGS RAZED
Even fight / razor-thin win	**~50%** — heavy collateral
Loser dealt half the winner's damage	~30%
Decisive blowout / undefended	**~10%** — region left mostly intact
No damage on either side (0–0)	nothing

> **TIP**
>
> Commit fully. A crushing victory takes the land **and** keeps its infrastructure standing; a costly grind leaves you holding rubble.

Buildings belong to the land: a conquered region keeps whatever survives for its new owner. Weapons are player-made (from iron), so every war is also an economy — someone armed both sides.

REBELLION

Regions can rise against their own state:

- Every state-owned, **non-capital** region carries a **5-point rebellion meter**, visible on the map panel and your dashboard's region box.
- Any player **physically present** in the region — no citizenship or permit needed — can **Support the rebellion** for **50 gold, which is burned**, not paid to anyone. One point per player; points persist until the rebellion ignites.
- No point can be added while the region is already at war, while it is under a **shield**, or for **7 days** after a crushed rebellion. A capital cannot revolt — the seat of government falls only to a declared war — and an

independent region has nothing to revolt against.

- At **5 distinct supporters a war starts automatically**: the rebels against the region's state, fought in the region itself for 24 hours. Everyone present picks a side, and their first strike locks that choice for the war.
- **If the rebels win, the region becomes independent** and its citizens are left without a state. If at least five of them are active, a new state forms there at once (see Citizenship & the World Map).
- If the state crushes the rebellion, the region cannot rebel again for **7 days**.

CONQUEST AND THE PEOPLE

When the attackers take a region, its **citizens come with the land**: every citizen of the region becomes a citizen of the conqueror at once (a rebel win leaves them stateless until a state forms). Citizens of the lost region who held the presidency or a cabinet seat lose it, and their candidacies in running elections are dropped. Party memberships are left for them to leave.

If the region was the defender's **last one, the state dissolves** — its government, parliament, parties, elections, laws, alliances, trade agreements, embargoes, work permits and citizenship applications all end. Only the treasury's **gold** passes to the conqueror; its local currency and the state's raw-material stockpile are lost with it. The war report says so. There is no government in exile.
